Motivations of Autonomic Computing

Source: IDC

AUTONOMIC VISION & MANIFESTO

<http://www.research.ibm.com/autonomic/manifesto/>

Self-managing system with the ability of

- **Self-healing**: detect, diagnose and repair problems
- **Self-configuring**: automatically incorporate and configure components
- **Self-optimizing**: ensure the optimal functioning wrt defined requirements
- **Self-protecting**: anticipate and defend against security breaches

Job stream monitoring by clustering

Goal: summarizing the **large scale** and **fast arriving** data.

- provide **compact description**
- help to find out **interesting patterns**
- **classify** the incoming data

Challenges:

- **Large size**
 - **save** all the data and process them **as a whole** ?
require **huge** disk, CPU, and memory (impossible for data in size of GB, TB, even PB, ..)
 - process the data **part by part** ?
how to guarantee the **global optimization**.
- **Changing distribution:**
for the time-ordered data, how to make the clusters **keep tracking the evolving data**?

What is Clustering ?

- **unsupervised** learning method
- **group similar** points together in the same group (cluster)
- widely used on various problems:
Interesting groups discovery, Data structure presentation, Data classification, Data compression, Dimensionality reduction or feature selection
- many clustering methods are available, e.g., Hierarchical clustering methods, Density-based methods(Dbscan), Partitioning methods(k -means)

Our requirements of clustering method

- No need to set the number K of clusters *double-edged sword*
- global optimization of clustering result:
 - not locally optimized by greedy approach
- stable clustering result:
 - not affected by the initialization
- real data points as **representative exemplars** (cluster center):
 - suit the application field when averaged centers are meaningless, e.g. molecule, jobs described by categorical attributes

Our requirements of clustering method

Introduction of AP

input:

Data: x_1, x_2, \dots, x_N Distance: $d(x_i, x_j)$

find:

$\sigma: x_i \rightarrow \sigma(x_i)$, exemplar representing x_i , such that

$$\max \sum_{i=1}^N S(x_i, \sigma(x_i))$$

where,

$$S(x_i, x_j) = -d^2(x_i, x_j) \quad \text{if } i \neq j$$

$$S(x_i, x_i) = -s^* \quad s^*: \text{user-defined parameter (penalty)}$$

- $s^* = \infty$, only one an exemplar (one cluster)
- $s^* = 0$, every point is an exemplar (N clusters)

AP: a message passing algorithm

Sending responsibilities

Sending availabilities

Message passed

Sending responsibilities

Sending availabilities

$$r(i, k) = S(x_i, x_k) - \max_{k', k' \neq k} \{a(i, k') + S(x_i, x'_k)\}$$

$$r(k, k) = S(x_k, x_k) - \max_{k', k' \neq k} \{S(x_k, x'_k)\}$$

$$a(i, k) = \min \{0, r(k, k) + \sum_{i', i' \neq i, k} \max\{0, r(i', k)\}\}$$

$$a(k, k) = \sum_{i', i' \neq k} \max\{0, r(i', k)\}$$

The index of exemplar $\sigma(x_i)$ associated to x_i is finally defined as:

$$\sigma(x_i) = \operatorname{argmax} \{r(i, k) + a(i, k), k = 1 \dots N\}$$

Summary of AP

Affinity Propagation (AP)

- A clustering method
- Converge by Iterations of Message passing
- No need of K (the number of clusters)
- Real point as exemplar
- an application of *belief propagation* (simplified graph + message passing)

cons

Computational complexity problems

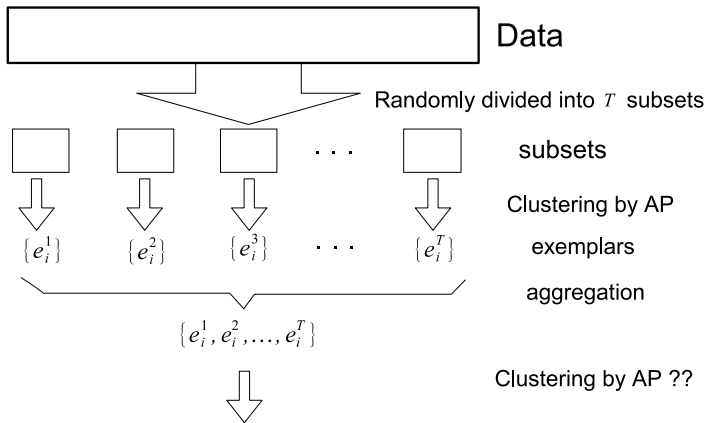

- Similarity computation: $\mathcal{O}(N^2)$
- Message passing: $\mathcal{O}(N^2 \log N)$

Hierarchical AP

Divide-and-conquer (inspired by Guha et al, TKDE2003)

Hierarchical AP

Divide-and-conquer (inspired by Guha et al, TKDE2003)

Weighted AP

AP

x_i

$S(x_i, x_j)$

→

price for x_i to select x_j as an exemplar

$S(x_i, x_j)$

→

price to select x_j as exemplar

WAP

x_i, n_i

$n_i \times S(x_i, x_j)$

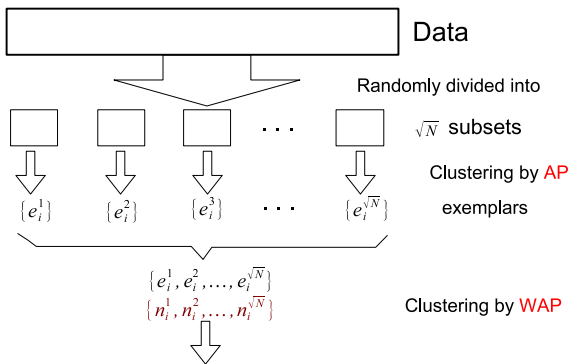

$S(x_i, x_j) + (n_i - 1) \times \epsilon$

ϵ is variance of n_i points

Proposition

WAP \equiv AP with duplications (aggregations)

Hierarchical AP

- Complexity of HI-AP is $\mathcal{O}(N^{3/2})$
(X. Zhang et al, ECML/PKDD 2008)
- NB: can be iteratively reduced to $\mathcal{O}(N^{1+\gamma})$
(X. Zhang et al, SIGKDD 2009)

Validation of HI-AP on EGEE jobs

- EGEE
(Enabling Grids for
E-sciencE)
- Grid Observatory
<http://www.grid-observatory.org/>

description of jobs (237,087)

- 4 numeric features: duration of execution
- 1 symbolic feature: name of queue

Validation of HI-AP on EGEE jobs

Evaluation: Distortion

$$D([\sigma]) = \sum_{i=1}^N d^2(x_i, \sigma(x_i))$$

- 237,087 jobs
- 10 mins on Intel 2.66GHz Dual-Core PC with 2 GB memory

HI-AP has the **lowest distortion** compared to baseline method

Challenges of Stream Clustering

Data stream:

a **real-time, continuous, ordered** sequence of items arriving at a very **high speed** (Golab & Özsu, SigMod2003)
e.g., network traffic data, sensor network monitoring data

Data streams clustering

- Provide **compact** description of data flow
- **Incremental** model updating
- **No** specified **number of clusters**
- Process in **real-time**
- **Available** results at **any time**

Related works

Divide-and-conquer strategy

(Guha et al, TKDE 2003)

fixed segmentation window \longrightarrow > not feasible to handle the changing distribution

Related works

A two-level scheme

(Aggarwal et al, VLDB 2003)

- **online level** to summarize the evolving data stream
- **offline level** to generate the clusters using the summary.
- **clustering** method is used to get **initial** micro-clusters and **final** clusters. e.g., Density-based clustering methods DBSCAN (Cao et al, SDM 2006)

Problem: the online clustering models is not provided or only available when it is required by users.

Stream clustering

Model

Reservoir

Stream clustering

Model

Reservoir

Does x_t fit the current model ??

- if yes, update the model
- otherwise, go to reservoir

Stream clustering

Model

Reservoir

Does x_t fit the current model ??

- if yes, update the model
- otherwise, go to reservoir

Stream clustering

Model

Reservoir

Does x_t fit the current model ??

- if yes, update the model
- otherwise, go to reservoir

Stream clustering

Has the distribution changed ??

CHANGE TEST

- if yes, rebuild the model
- otherwise, continue

Stream clustering

Has the distribution changed ??

CHANGE TEST

- if yes, rebuild the model
- otherwise, continue

STRAP Method

Does x_t fit the current model ??

- if yes, **update the model** update the weight with **time decay** (decay window Δ)
- otherwise, go to reservoir

Has the distribution changed ??

- if yes, **rebuild the model** based on current model and reservoir by WAP
- otherwise, continue

Rebuild the model??

- when reservoir is full
- when changes are detected: Page-Hinkley statistic (Cumulative-Sum-like test)

(Page, Biometrika1954; Hinkley, Biometrika1971)

p_t changing distribution

$$\bar{p}_t = \frac{1}{t} \sum_{\ell=1}^t p_{\ell}$$

$$m_t = \sum_{\ell=1}^t (p_{\ell} - \bar{p}_{\ell} + \delta)$$

$$M_t = \max\{m_{\ell}\}$$

$$PH_t = M_t - m_t$$

if $PH_t > \lambda$, changed detected

How to set λ ???

Setting of λ

- fixed empirical value (X. Zhang et al, ECML/PKDD 2008)
- self-adaptive change detection test (X. Zhang et al, SIGKDD 2009)

Self-adapt λ \equiv An optimization problem

$$\text{BIC: } \mathcal{F}_\lambda = \frac{1}{|C|} \sum_{i=1}^{|C|} \left(\frac{1}{n_i} \sum_{e_j \in C_i} d(e_j, e_i^*) \right) + \varphi \frac{\rho}{2} \log N + \eta O_t$$

\propto loss + size of model + percentage of outlier

OPTIMIZATION:

- ϵ -greedy search from a finite set of λ values

$$\lambda = \operatorname{argmin}\{\mathbf{E}(F_\lambda)\},$$

λ_1	λ_2	λ_3	λ_4	...
$\mathbf{E}(F_{\lambda_1})$	$\mathbf{E}(F_{\lambda_2})$	$\mathbf{E}(F_{\lambda_3})$	$\mathbf{E}(F_{\lambda_4})$...

- **Gaussian Process Regression** based on $\{\lambda_i, F_{\lambda_i}\}$
continuous value of λ is generated

Validation of STRAP on KDD99 data

Data used

- Real world data: KDD99 data
 - intrusion detection benchmark
 - 494,021 network connection records in \mathbb{R}^{34}
 - 23 classes: 1 normal + 22 attacks
- Baseline: *DenStream* (Cao et al, SDM2006)

Performance indicator (supervised setting)

- Clustering accuracy
- Clustering purity

KDD Cup 1999 data: <http://kdd.ics.uci.edu/databases/kddcup99/kddcup99.html>.

Accuracy and Purity along time

Error Rate along time $< 2\%$

Higher clustering purity than DenStream

Discussion

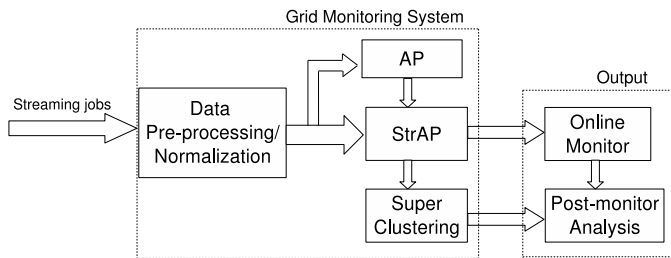

STRAP vs *DenStream*

- Pros
 - better accuracy
 - Truth Detection rate: 99.18%
 - False Alarm rate: 1.39%
 - Online Error rate < 2%
 - model available at any time
- Cons
 - *DenStream*: 7 seconds
 - STRAP : 7 mins

Multi-scale Realtime Grid Monitoring System

Multi-scale Realtime Grid Monitoring System

Multi-scale Realtime Grid Monitoring System

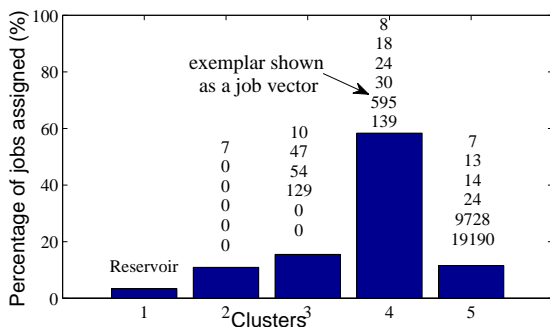

Experimental Data

- EGEE logs of 39 RBs during 5 months (2006-01-01 ~ 2006-05-31)
- 5,268,564 jobs
- for each job, its
 - final status (good or type of errors)
 - **6 features** describing the **time-cost** of services in a job lifecycle

Experimental Results: Online Monitoring outputs

Real-time Monitoring: when change detected

Online summarizing the streaming jobs into clusters:

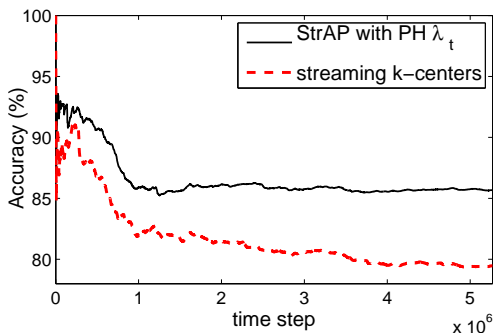

Real-time Monitoring: when change detected

Online summarizing the streaming jobs into clusters:

Clustering Accuracy

10% higher than baseline method(Streaming k -centers)

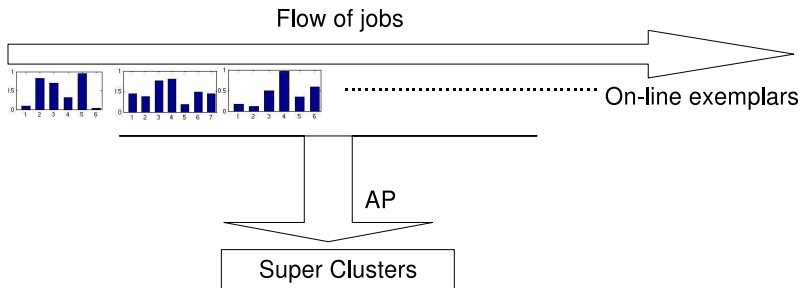

Discussion

- Real-time quality (330K jobs/day):
 - tested on Intel 2.66GHz Dual-Core PC with 2 GB memory
 - **10k jobs per minute** coding in **Matlab**
 - **60k jobs per minute** coding in **C/C++**
- **concise online summary** of the streaming jobs, with
 - **proportion** of defects
 - performance of the grid services

Experimental Results: Offline Analysis

Large-time scale Monitoring: Global view

- the history behavior of interesting exemplars
- without prior knowledge about failure patterns
- summarizing Gbyte data

Bad Super Exemplars: day view

“early stopped error”, **Who and When ?**

Date	Jan 7~13	Jan 30 ~ Feb 3	Mar 16~21	May 17~19
UserID	A1	A1	B1	D1 and A1

Discussion and Conclusion

- **real-time monitoring** Grid job streams
- providing **multi-scale** models to describing the status of Grid
 - proportion of different type of job patterns (realtime-view, day-view, week-view)
 - rupture steps
 - offline globally analysis
- **good quality clustering** is guaranteed

Contents

- 1 Motivation

- 3 STRAP : Clustering Streaming Data
 - Challenges and Related Work
 - STRAP Algorithm
 - STRAP Application on Intrusion Detection (KDD99 data)
 - A STRAP-based Real-time Online Grid Monitoring System
- 4 Conclusion and Perspectives

Conclusion, Algorithm

Scalability: HI-AP

- Reduce complexity from $\mathcal{O}(N^2)$ to $\mathcal{O}(N^{3/2})$
- Iteratively reduce toward $\mathcal{O}(N^{1+\gamma})$

Stream clustering: STRAP

- Framework of processing the streaming data
- Hybridized with an efficient change detection method, Page-Hinkley
- Model available at any time
- BUT: slower than DenStream

Conclusion, Application

Network Intrusion Detection (KDD99 data)

- clustering by **one-scan** of the data
- using only $< 1\%$ data for building model **Active Learning**
- **high** clustering and classification **accuracy**

Autonomic Grid Computing

- real-time grid monitoring system
- **visualized online output** describing grid running status
- **offline output** for historical performance analysis
- multi-scale analysis of system behaviors

Ongoing work

Flexible Clustering Methods

- Fixed number clusters by messaging passing
- Arbitrary shape clusters by messaging passing
- Comprehensive model of streaming data
using several representative exemplars covering the cluster, instead of one center point

Online Learning

- Assess the alarm level attached to a given model
criticality of the clusters based on its frequency along time
- User profiling
the clusters \rightarrow new features \rightarrow describe the users (viewing a user as a set of clusters)

Thank you for your attention.
