Introduction

Objectives of this talk...

- ▶ Define the Domino problem (**DP**).
- \blacktriangleright Show the two main techniques to prove undecidability of DP on \mathbb{Z}^2

Undecidability of DP on Z², proof I

Undecidability of DP on \mathbb{Z}^2 , proof II 000000000

Outline of the talk.

2 Undecidability of DP on \mathbb{Z}^2 , proof I

3 Undecidability of DP on \mathbb{Z}^2 , proof II

Undecidability of DP on Z², proof I

Undecidability of DP on Z², proof II

Configurations and Subshifts (I)

- Let A be a finite alphabet, G be a finitely generated group.
- Colorings $x : G \to A$ are called **configurations**.
- Endowed with the prodiscrete topology A^G is a compact and metrizable set.
- ► Cylinders form a clopen basis

$$[a]_g = \left\{ x \in A^G \mid x_g = a \right\}.$$

- A pattern is a finite intersection of cylinders, or equivalently a finite configuration p : S → A
- A metric for the cylinder topology is

$$d(x,y) = 2^{-\inf\{|g| \mid g \in G: x_g \neq y_g\}},$$

where |g| is the length of the shortest path from 1_G to g in $\Gamma(G, S)$.

Undecidability of DP on Z², proof I

Undecidability of DP on \mathbb{Z}^2 , proof II 000000000

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Configurations and Subshifts (II)

The **shift** action $\sigma: G \times A^G \to A^G$ is given by

 $(\sigma_g(x))_h = x_{g^{-1}h}.$

The dynamical system (A^G, σ) is called the *G*-fullshift over *A*.

Definition

A *G*-subshift is a closed and σ -invariant subset $X \subset A^G$.

Undecidability of DP on Z², proof I

Undecidability of DP on Z², proof II

Configurations and Subshifts (II)

The **shift** action $\sigma: G \times A^G \to A^G$ is given by

 $(\sigma_g(x))_h = x_{g^{-1}h}.$

The dynamical system $(A^{\mathcal{G}}, \sigma)$ is called the *G*-fullshift over *A*.

Definition

A *G*-subshift is a closed and σ -invariant subset $X \subset A^G$.

A pattern $p \in A^S$ appears in a configuration $x \in A^G$ if $(\sigma_g(x))_S = p$ for some $g \in G$.

Proposition

X is a G-subshift iff there exists a set \mathcal{F} of forbidden patterns s.t.

$$X = X_{\mathcal{F}} := \left\{ x \in A^{\mathcal{G}} \mid \text{ no pattern of } \mathcal{F} \text{ appears in } x
ight\}.$$

Undecidability of DP on Z², proof I

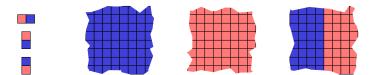

Undecidability of DP on \mathbb{Z}^2 , proof II 000000000

◆□▶ ◆□▶ ★□▶ ★□▶ □ のQ@

Subshifts of finite type

A *G*-subshift X is **of finite type** (*G*-SFT) if there exists a finite set of forbidden patterns \mathcal{F} that defines it: $X = X_{\mathcal{F}}$.

Example:

How to initialize computations ?

Build one infinite in time and space computation zone?

► Compactness ⇒ we cannot force one given tile to appear exactly once in every valid tiling

Build arbitrarily big computation zones?

► Compactness ⇒ if we have arbitrarily big *rectangles* in our tilings, then we also have a tiling with no rectangle.

One solution: hierarchy of computation zones (thus arbritrarily big zones) that intersect a lot.

Mortality problem of Turing machines

Take M a deterministic Turing machine with an halting state q_f .

!! configurations of ${\mathcal M}$ do not have finite support !!

A configuration (x, q) is a **non-halting configuration** if it never evolves into the halting state.

Mortality problem of Turing machines

Take M a deterministic Turing machine with an halting state q_f .

!! configurations of ${\mathcal M}$ do not have finite support !!

A configuration (x, q) is a **non-halting configuration** if it never evolves into the halting state.

Mortality problem of Turing machines

 $\label{eq:input: a deterministic Turing machine \mathcal{M} with an halting state.} \\ \textbf{Output: Yes} if \mathcal{M} has a non-halting configuration, No otherwise.} \\$

Theorem (Hooper, 1966)

The Mortality problem of Turing machines is undecidable.

Proof: very technical, uses Minsky 2-counters machines.

Undecidability of DP on Z², proof I

Undecidability of DP on ℤ², proof II ●0000000

Rational piecewise affine maps in \mathbb{R}^2

Take $f_i : U_i \to \mathbb{R}^2$ for $i \in [1; n]$ some rational affine maps, with U_1, U_2, \ldots, U_n disjoint unit squares with integer corners.

Define $f : \mathbb{R}^2 \to \mathbb{R}^2$ with domain $U = \bigcup_{i=1}^n U_i$ by $\overrightarrow{x} \mapsto f_i(\overrightarrow{x})$ if $\overrightarrow{x} \in U_i$.

A point $\vec{x} \in \mathbb{R}^2$ is an **immortal starting point** for $(f_i)_{i=1...n}$ if for every $n \in \mathbb{N}$, the point $f^n(\vec{x})$ lies inside the domain U.

Mortality problem of piecewise affine maps

Input: a system of rational affine maps f_1, f_2, \ldots, f_n with disjoint unit squares U_1, U_2, \ldots, U_n with integer corners. **Output:** Yes the system has an immortal starting point, No otherwise.

Undecidability of DP on \mathbb{Z}^2 , proof II

Rational piecewise affine maps and Turing machines (I)

We use the **moving tape** Turing machines model.

Assume that $\mathcal M$ has alphabet $A=\{0,1,\ldots,a-1\}$ and states $Q=\{0,1,\ldots,b-1\}.$

Given \mathcal{M} a Turing machine, we construct a system f_1, f_2, \ldots, f_n of piecewise affine maps s.t.

- \blacktriangleright A configuration of ${\cal M}$ is coded by two real numbers.
- A transition of \mathcal{M} is coded by one f_i .
- ▶ $f_1, f_2, ..., f_n$ has an immortal starting point if and only if \mathcal{M} has an immortal configuration.
