Information Access based on User Preferences

4/32

Information Access based on User Preferences

General Problem

- Internet and Web provides huge amount of information
- Internet and Web casual users are increasing
- Information is useful to user when:
 - can be retrieved from an information source easily
 - retrieved results can be presented in an understandable way to user

Information Access based on User Preferences Nicolas Spyrtos

3/32

Information Access based on User Preferences

- The World Wide Web is exploited by more and more people

Year	Number of Users
1998	20,000,000
2000	300,000,000
2004	1,000,000,000
2005	1,500,000,000

7/32
Information Access based on User Preferences

Personalization

- How to achieve personalization?
 - By incorporating user preferences in the dialogue between the user and the information system

Information Access based on User Preferences | Nicolas Spiratos

2
Information Access based on User Preferences

Preferences

- How can a user express preferences?
- Preferences are distinguished by:
 - Nature:
 - Quantitative: 'I like BMWs 80%'
 - Qualitative: 'I like BMWs more than VWs'
 - Duration:
 - Long term: system mining query logs
 - Short term: expressed explicitly by the user
- This work focuses on short term, qualitative preferences

Information Access based on User Preferences | Nicolas Spiratos

8/32
Information Access based on User Preferences

Information System

- An information system extends the database with a couple of software tools for querying, presenting, transforming and analyzing the data.
- Tabular data: tables contain items and records or rows and columns

Information Access based on User Preferences | Nicolas Spiratos

Information Access based on User Preferences

Information System Problems

- Tables contains thousands of rows, so the answer set of the query can be:
 - Very small, thus unsatisfactory for the user
 - We have to enlarge the query
 - Very large, thus difficult to exploit by the user
 - We have to narrow the query
- Our paper addresses the problem of very large answer sets by rewriting the query and using user's preferences

Information Access based on User Preferences | Nicolas Spiratos

12/32
Information Access based on User Preferences

Preferences

- How can preferences be used to rewrite the user query?
- We embody the rewriting in the query language to generate preference query
- Preference query: is an ordinary query together with a set of preferences expressed by the user online.

Information Access based on User Preferences | Nicolas Spiratos

2

Information Access based on User Preferences

Preference Query

- The user submits a query Q and his preferences online
- The system rewrites Q into a sequence of sub-queries $Q_1 \rightarrow Q_2 \rightarrow \dots \rightarrow Q_n$ whose answers contain the information retrieved in decreasing order of preferences
- User can stop the presentation of sub-queries results at any time he decides to

Information Access based on User Preferences Nicolas Spyratos

16/32

Information Access based on User Preferences

Example: Electronic Catalog for Cars

- preference query $\langle Q, P.A \rangle$
 - Q is an ordinary query
 - $P.A$ is a preference relation, we say " t is preferred to t' " if $t.A \rightarrow t'.A$ is in $P.A$
- $P.\{Model, Color\}$:
 Red \wedge VW \rightarrow Yellow \wedge BMW,
 Black \wedge VW \rightarrow Yellow \wedge BMW
- The answer to the preference query is:

$$Q_0 = Q \wedge ((Red \wedge VW) \vee (Black \wedge VW))$$

$$Q_1 = Q \wedge (Yellow \wedge BMW)$$

$$Q_2 = Q \wedge \neg(Q_0 \vee Q_1)$$
 - where top blocks of are more close to user interests

Serial	Model	Colour	Mileage	Price	Year
1	BMW	Black	15000	15000	2005
2	BMW	Black	40000	15000	2005
3	VW	Black	20000	20000	2005
4	BMW	Black	20000	20000	2005
5	VW	White	20000	20000	2005
6	BMW	Yellow	15000	15000	2005
7	BMW	Black	15000	15000	2005
8	VW	Black	20000	20000	2005
9	VW	White	15000	20000	2005

Information Access based on User Preferences

Multiple Preferences and Priorities

- More than one preferences e.g.
 $P.Model: BMW \succ W, BMW \succ Honda, V W \succ Honda$
- Preference on another attribute e.g.
 $P.Color: Red \succ Yellow, Black \succ White, White \succ Yellow$
- Combination of two attributes e.g.
 $P.\{Model, Colour\}: Red \text{ and } BMW \succ Yellow \text{ and } V W$
- Preferences over more than one attributes separately e.g.
 $P.Model: BMW \succ VW, BMW \succ Honda$
 $P.Color: Red \succ Yellow, Black \succ White$
- User might define priorities on preferences in the above case e.g.
 Priorities: $P.Model \succ P.Color$

Information Access based on User Preferences Nicolas Spyratos

15/32

Information Access based on User Preferences

Example: Electronic Catalog for Cars

- $Q = [(Model = BMW) \vee (Model = VW)] \wedge (Mileage \leq 40000 \text{ Km})$
- Result:
 $ans(Q) = (\{1, 2, 6\} \cup \{3, 5, 8, 9\}) \cap \{1, 3, 5, 6, 7, 8, 9\} = \{1, 3, 5, 6, 7, 8, 9\}$
- Problem:
 Result set could be very large and cars of the user's interest could be lost
- Our solution is to present the results cars in descending order, according to user preferences.

Serial	Model	Colour	Mileage	Price	Year
1	BMW	Black	15000	15000	2005
2	BMW	Black	40000	15000	2005
3	VW	Black	20000	20000	2005
4	BMW	Black	20000	20000	2005
5	VW	White	20000	20000	2005
6	BMW	Yellow	15000	15000	2005
7	BMW	Black	15000	15000	2005
8	VW	Black	20000	20000	2005
9	VW	White	15000	20000	2005

Information Access based on User Preferences Nicolas Spyratos

18/32

Information Access based on User Preferences

Interface

- Input of Queries, Preferences and priorities
- Control of Presentation of answer set by two buttons "Next" and "Stop"

Information Access based on User Preferences Nicolas Spyratos

19 / 32

Information Access based on User Preferences

Interface

- **Searching the table:** User enters ordinary query Q i.e. Where Attribute = value
- **Preferences:** Selection of attribute by menu, then declares pairs of values of that attribute
- **Priorities:** If more than one preference relation declared, user is asked to declare priorities

Information Access based on User Preferences Nicolas Spyratos

22 / 32

Information Access based on User Preferences

Conclusion and Perspectives

- **Conclusion**
 - § Keep the task of user as simple as possible
 - § Preference queries are different from Order-By Instruction of SQL
- **Perspectives**
 - § Creating intervals over attributes e.g. Mileage or Price

Information Access based on User Preferences Nicolas Spyratos

20 / 32

Information Access based on User Preferences

Control of Presentation

- **Controlling the Presentation:** By two buttons "Next" and "Stop"
- Next button pressed when user wants to see the next block
- Stop will stop further execution i.e. user has found his interest
- Records of User interest will be shown in descending order thus no need to execute all the sub queries in the answer to the preference query

Information Access based on User Preferences Nicolas Spyratos

23 / 32

Information Access based on User Preferences

Further Explanation

- Order By vs Preference Queries
- Explanation of Algorithm

Information Access based on User Preferences Nicolas Spyratos

Information Access based on User Preferences

Order By vs Preference Queries

- **Preference Queries** differ from Order By instructions
- **Order-By** sorts the data (Ascending or Descending) following the predefined order of some attribute domain
 - § E.g. the predefined order over the domain of attribute price is that of integers

Information Access based on User Preferences Nicolas Spyratos

Order By vs Preference Queries

- In preference queries User inputs an order for attribute domain (this order may conflict the order of attribute domain)
- Some attribute domain have no predefined order (domains of Model and color are un-ordered), Order By doesn't work here
- Preference queries can be applied on any attribute without considering ordering of domain

Example: Two attributes preference relation

- $P.\{Model, Color\}$:
Red[^]VW^{->}Yellow[^]BMW, Black[^]VW^{->}Yellow[^]BMW
- The answer to the preference query is the following sequence:
Q0=Q[^][(Red[^]VW)[^](Black[^]VW)]
Q1=Q[^](Yellow[^]BMW)
Q2=Q[^]¬(Q0[^]Q1)

Further Explanation

- Order By vs Preference Queries
- Explanation of Algorithm

Evaluation of Preference Queries

Algorithm

Input: A preference query $\langle Q, P, A \rangle$ such that the graph $G(P, A)$ is acyclic.
Output: The sequence Q_0, Q_1, \dots, Q_{m+1} answering the preference query

Method:

```

1/ Ordered-partition( $G(P, A)$ ) (the output is a sequence  $B_0, B_1, \dots, B_m$  of sets of values of  $A$ )
2/ For each  $i=0, 1, \dots, m$  do
begin
  Qi := conjunction of all values of  $A$  in  $B_i$ ;
  Qi := Q^Qi;
  output Qi
end
3/ Qm+1 := Q^¬(Q0Q1...vQm);
output Qm+1

```
